

What did you learn from the websites on careers in web design and development?

After looking through the various jobs for those with web development skills, what struck me first was that employers are often looking for employees who know many programming languages, not just a few. Another thing I learned is that the ones that looked most interesting to me were the ones that paid the least!

What did you learn from this class in general?

The best thing this class has taught me is that I actually learned a lot from my other programming classes. There were a lot of things I remember finding particularly difficult (like GitHub) that I discovered I actually knew how to use when doing assignments for this class. I didn't think HTML or CSS would really apply to what I'm interested in, but all programming languages have common threads that connect them. Learning a new language is sure to increase your marketability since they are somewhat related no matter the application.

I also learned not to be afraid of trying new things that I never thought I'd be interested in. I can't say I'm a huge fan of HTML, but I did enjoy seeing the website come together and discover new ways to manipulate the photos and text.
